1.0 INTRODUCTION

Weston & Sampson Engineers Inc. (WSE) has been retained by the Town of Lexington to perform a Traffic Study of the Massachusetts Avenue (Mass Ave) corridor from Marrett Road to Pleasant Street. The purpose of this study is to address traffic, safety and operational deficiencies within this stretch of Massachusetts Avenue.

1.1 Project Description

The Project Study Area includes the Mass Ave corridor from Marrett Road to Pleasant Street and all links and intersections in between. The corridor includes three (3) unsignalized intersections as follows: Mass Ave/Marrett Road, Mass Ave/Maple Street and Mass Ave at Pleasant Street and Follen Road. In addition, there are two signalized locations within the corridor including a signal at the Lexington Fire Station on the corner of Mass Ave and Locust Street and a pedestrian signal for crossing of school children from the local school and athletic fields to the rear.

We have driven the project area and made particular note of the operational and physical constraints of Mass Ave and each intersection along the route from Pleasant Street (Rte 4/225) to Marrett Road (Rte 2A). In addition, we have also investigated the area on a subsequent weekday afternoon at about 4 PM to see how the corridor operates during peak conditions and noted the following observations.

During this time period Mass Ave was experiencing heavy traffic volumes, making it easy to see possible reasons for delays at the study area intersections. The Mass Ave corridor, within the study area, consists of one lane in each direction with exclusive left turn lanes southbound onto Maple Street and northbound onto Marrett Road. In general there is a generous travel lane width and a white painted fog lines in areas near the intersections. Some locations have unregulated parking in front of residences along the route.

Marrett Road at Mass Ave is a non-signalized “T” intersection. An exclusive left turn lane and a through lane from northbound Mass Ave allows traffic to proceed on Mass Ave without being deterred by the Marrett Road turning traffic. However, the southbound Mass Ave traffic flow makes it difficult to enter from Marrett Road during peak traffic times of the day and northbound Marrett Road left turning traffic waits for long periods of time to find a break in the Mass Ave traffic stream.

Mass Ave at Maple Street (Rte 2A) operates as a non-signalized “T” intersection with a round, planted, channelization island in the center. The island contains a mature tree; some low growing plantings and several utility poles that obscures the sight distance from Maple Street to the south and makes it difficult to see left turning traffic from Maple Street while driving northbound on Mass Ave. There is a left turn lane from southbound Mass Ave onto Maple Street and a generous one-lane approach to Maple Street from northbound Mass Ave. The Maple Street approach to Mass Ave splits into a left and right turn lane separated with a painted island. This approach is a sea of pavement that might be made smaller and more efficient in the future. The driveway access to a gas station on the northeast corner of the intersection adds to the

confusion of the Maple Street traffic. There doesn't appear to be any formal pedestrian safety features such as crosswalks and the like at this intersection.

The intersection of Pleasant St/Mass Ave consists of a round island median at the intersection. It looks like a roundabout, but due to the configuration does not operate as such. Pleasant Street enters the intersection and is stop sign controlled at Mass Ave while Follen Road enters into the intersection and is stop sign controlled at this location. The round island is offset from Mass Ave providing no traffic calming relief to the intersection. Mass Ave has little to no obstructed flow making it difficult to enter onto Mass Ave from Pleasant St. The roundabout is planted with trees and shrubs that obscure the sight distance to all portions of the intersection, posing a safety hazard for motorists and pedestrians. Pedestrian crosswalks are located on the outside of the roundabout and appear to create long walking distances.

In general, the pavement condition throughout the corridor is good with spotty locations of localized cracking and trench patching. Sidewalks are in fair shape and consist of areas of hot mix asphalt and areas of cement concrete. Curb reveal is moderate and inconsistent within the corridor and tree lawn areas are in fairly good condition.

The intent of the project is to facilitate traffic flow and improve vehicular and pedestrian safety at the intersections, roadway links and respective approaches. Specific improvements to be studied as they relate to the operation of the corridor may include the following:

- Roadway widening or narrowing
- Geometric improvements to accommodate new lane configurations
- Installation of traffic signal systems if appropriate.
- Installation of new pavement markings and traffic signs.

1.2 Data Collection And Field Investigation

In order to evaluate the layout of Mass Ave and the intersections within the corridor a base plan was compiled to be utilized as a talking board for public hearings and to allow the roadway configuration, lane arrangements and widths, traffic data and the like to be compiled. This work was not performed by an instrument survey, but rather measurements of the physical attributes of the roadway and geometry of the intersections within the corridor. The linework and details gathered from the field measurements were transferred onto Mass GIS bases to show the limits of our work and how it blends into the existing conditions. Measurements taken include general alignment angles, roadway curb-to-curb widths, lane widths, offset line distances, lengths of stacking and turning lanes, limits of islands and sidewalk widths. This base plan will allow us to make sketch plans of proposed geometric and lane alterations and show how they line up and blend with existing conditions within the corridor.

Automatic Traffic Recorder (ATR) counts were performed by WSE at all major roadway links within the study area (see App B). These counts are taken with air hoses stretched across the

particular roadway section to count the number of vehicles passing that point at any given 15-minute period of the counting cycle. These ATR machines counted directional traffic flow for 24 hours of a mid week in March (Tues, 3/31/09) and also classified the type of vehicles that make up the total traffic counts. The ATR machines classify the vehicles based on the number of axles and are categorized as Bikes, Car & Trailers, 2 Axle (Long), Buses and a number of combinations of other axle configurations. The locations for the 24-hours counts are as follows:

- Mass Ave North of Marrett Road
- Mass Ave South of Marrett Road
- Mass Ave South of Pleasant Street
- Marrett Road West of Mass Ave
- Maple Street East of Mass Ave
- Pleasant Street South of Fern Street

Turning movement counts were also performed by WSE during a typical weekday (Tues, 3/31/09) between 7:00 AM to 9:00 AM and 4:00 PM to 6:00 PM. These counts will be utilized to perform the capacity and queue analysis on each of the three (3) intersections and to act as a base condition for the expanding of the counts to a period twenty years in the future for design of traffic equipment. The counts were analyzed in terms of the corridor and balanced between intersections to account for any discrepancies between the count locations due to side streets or the like.

Accident history was obtained from the Lexington Police Department dating back three years (1/1/05 to 12/31/08). A total of eighty eight (88) accidents were recorded with the Police Department during this time period at or near the corridor intersections and are included in this report (See Appendix F).

1.3 Analysis Designation

The Massachusetts Highway Department (MassHighway) requires an evaluation of existing traffic flow operations and future operations with and without improvements in place. In addition to these scenarios, Mass Highway requires analysis of how the design would impact existing traffic volume levels if it were in place today. Although this is not a study for MassHighway we have prepared the study so that the Town can easily adapt the study for future use in MassHighway submittals. The scenarios examined as part of this study include:

- Existing 2009 volumes analyzed under existing non-signalized condition
- Projected 2029 volumes analyzed under existing non-signalized condition (Because the existing intersections operate at an unacceptable LOS it is assumed the LOS will be worse in the future and this analysis was not required)
- Existing 2009 traffic volumes analyzed under proposed traffic control
- Projected 2029 traffic volumes analyzed under proposed traffic control

A twenty (20) year design condition has been utilized as a measure of continued effectiveness of the proposed improvements.

1.4 Area Growth/Design Year Volumes

Once the existing peak hour volumes were obtained, projected peak hour traffic volumes for the design year 2029 were developed.

Based on the anticipated impacts of local development, a **one-percent per-year growth rate** was used to account for regional traffic growth. This rate was applied to existing traffic volumes over the entire 20-year period to accommodate for planned development, and regional increases in population and employment. The 2029 morning and evening peak hour traffic volume networks derived from these projections are shown in the Appendix.

1.5 Safety Analysis

This report includes a detailed safety analysis for the intersection in the Project corridor. Roadway safety deficiencies are defined and discussed based on this analysis with respect to existing conditions. The Appendix provides a summary of accident history data obtained from the Town of Lexington Police Department and MassHighway. Based on the 88 accidents in the three (3) sampled years, the corridor and all intersections are substantially above the MassHighway Crash Rates for typical intersections.

2.0 EXISTING CONDITIONS

2.1 Geometry

Mass Ave is a major east-west roadway bisecting the Town of Lexington. The Project corridor included in this study is located at the overlap of Route 2A and Routes 4/225. It is approximately 0.8 miles to the north of the intersection of Routes 4/225 and the Route 2 interchange.

Within the Project corridor Mass Ave traverses in a general north-south direction and is predominantly a two-lane roadway. The typical cross section consists of approximately 40-feet of pavement from curb to curb. Between Marrett Road and Maple Street intersections there is a 2-foot paved shoulder on both sides of Mass Ave and a 12-foot exclusive left turn lane northbound from Mass Ave to Marrett Road and an 11-foot exclusive left turn lane southbound Mass Ave to Maple Street. The rest of the corridor has no paved shoulders and is configured into an oversized northbound and southbound lane measuring between 19 feet to 22 feet in width. There are sidewalks on both sides of Mass Ave within the Project corridor that are constructed of hot mix asphalt with tree lawns of varying dimensions on the granite curb edge of the corridor.

SCALE: NOT TO SCALE

GRAPHIC SCALE
NO SCALE

FIGURE 4
MASSACHUSETTS AVE. / PLEASANT ST. INTERSECTION
SCALE: NOT TO SCALE

Marrett Road, within the Project limits, traverses in a general east-west direction and is a two-lane roadway. It operates as a non-signalized “T” intersection with Mass Ave. The typical cross section consists of approximately 31-feet of pavement from curb to curb. There is a 4-foot paved shoulder on both sides of Marrett Road with an 11-foot westbound travel lane and a 12-foot east bound approach lane. The pavement width flares at the intersection with Mass Ave to allow for 2-3 right turning vehicles to stack apart from the left turning vehicles. There are sidewalks on both sides of Mass Ave within the Project corridor that are constructed of hot mix asphalt with tree lawns of varying dimensions on the granite curb edge of the corridor.

Maple Street, within the Project limits, traverses in a general east-west direction and is a two-lane roadway and operates as a non-signalized “T” intersection with Mass Ave. The typical cross section consists of approximately 28-feet of pavement from curb to curb. There are two 14-foot travel lanes approximately 100 feet east of the intersection with Mass Ave and there are no paved shoulders in this location. At the intersection with Mass Ave Maple Street flares to an exclusive right turn slot and a left turn lane is formed at a round vegetated island. The island contains a mature tree; some low growing plantings and several utility poles that obscures the sight distance from Maple Street to the south and makes it difficult to see left turning traffic from Maple Street while driving northbound on Mass Ave. A gas/service station is located on the northeast corner of the intersection with drive openings entering into the right turn lane. There is a sidewalk on the south side of Maple Street constructed of hot mix asphalt with a tree lawn of varying dimensions on the granite curb edge of the corridor.

Pleasant Street, within the Project limits, traverses in a general north-south direction and is a two-lane roadway. It operates as a non-signalized “T” intersection with a round vegetated island serving as a channelization device. It looks like a roundabout, but due to the configuration does not operate as such. Pleasant Street is stop sign controlled at Mass Ave while Follen Road enters into the intersection and is stop sign controlled at this location. The round island is offset from Mass Ave providing no traffic calming relief to the intersection. Mass Ave has little to no obstructed flow making it difficult to enter onto Mass Ave from Pleasant St. The round island is planted with trees and shrubs that obscure the sight distance to all portions of the intersection, posing a safety hazard for motorists and pedestrians. Pedestrian crosswalks are located on the outside of the roundabout and appear to create long walking distances.

The pavement conditions for the corridor were evaluated during a site visit. As a result, it was noted that the pavement along Mass Ave between Marrett Road and Maple Street is in fairly good condition while the pavement from Maple Street to Pleasant Street shows minor cracking in limited areas and is not in as good a condition as the latter section. In general, the pavement condition throughout the corridor is good with spotty locations of localized cracking and trench patching. Sidewalks are in fair shape and consist of areas of hot mix asphalt and areas of cement concrete. Curb reveal is moderate and inconsistent within the corridor and tree lawn areas are in fairly good condition.

All intersections within the study corridor are operating as unsignalized intersections with pedestrian signals at the Lexington Fire Station (on the corner of Locust Street) and opposite the driveway to the local school and Adams Field.

2.2 Peak Hour Traffic Volumes

Automatic Traffic Recorder (ATR) and Manual Turning Movement Counts were performed within the corridor limits during an average weekday in the month of March 2009. The Average Daily Traffic (ADT) volumes have been determined from ATR counts and are listed in Table 2.1.

Table 2.1
Daily Traffic Volumes

Location	DIR	ADT	
		DIR ADT	TOT ADT
Mass Ave North of Marrett	NBD	6629	
	SBD	7203	13832
Mass Ave South of Marrett	NBD	8772	
	SBD	9646	18418
Mass Ave South of Pleasant	NBD	6412	
	SBD	6055	12467
Marrett Road West of Mass Ave	EBD	3946	
	WBD	3714	7660
Maple Street East of Mass Ave	EBD	6166	
	WBD	5924	12090
Pleasant Street South of Mass Ave	NBD	5886	
	SBD	6896	12782

The peak hours for the AM and PM periods were determined from the largest sum of four 15-minute contiguous time periods from the turning movement counts. The AM peak hour occurred between 7:45 and 8:45 AM. The PM peak hour occurred between 4:45 and 5:45 PM.

These peak hour traffic volumes were used to determine existing Level of Service (LOS).

2.3 Level Of Service

Definition

Level of Service (LOS) is an indicator of the operating conditions at a particular intersection or road segment during a particular hour. The LOS rating at an intersection is based upon the calculation of delay per approaching vehicle. The amount of delay is dependent upon many factors such as: traffic volumes, roadway characteristics, speed, and phasing and timing of traffic signals. There are six levels-of-service that are defined. These levels-of-service are expressed by the letters "A" through "F"; "A" being the best (free flow), "F" being the worst (no movement). In practice, any given roadway or intersection may operate at a wide range of LOS ratings depending upon time of day, day of week, or period of year. A LOS rating of "C", a condition of stable flow, is considered desirable for peak or design flow in rural areas. A LOS rating of "D" is considered acceptable in urban areas.

For non-signalized intersections, LOS is measured in terms of average vehicle delay. Delay time is an indicator of driver comfort and frustration, fuel consumption, and lost productivity due to time delays. The average delay is evaluated using a mathematical model that calculates the number of gaps in the traffic stream that will be available for each minor movement at the intersection. The minor movement consists of all side street movements plus left turns from the major street, with the basic assumption that the major street movement is not restricted by the minor street movement and the left turns from the major streets are made from left turn lanes. The definitions for the LOS ratings at non-signalized intersections are provided in Chapter 10 of the 2000 Highway Capacity Manual and are summarized in Table 2.2.

Table 2.2
Levels of Service Criteria
Non-Signalized Intersections

Levels of Service	Delay per Vehicle (Seconds)
A	< 10.0
B	10.1 To 15.0
C	15.1 To 25.0
D	25.1 To 35.0
E	35.1 To 50.0
F	> 50.0

For signalized intersections, LOS is measured in terms of average individual stopped delay. Delay time is an indicator of driver comfort and frustration, fuel consumption, and lost productivity due to time delays. Mathematically, delay time is a function of traffic progression, signal cycle length, and the ratio of volume to capacity for the lane group, approach, and intersection under study. The definitions for the LOS ratings at signalized intersections are provided in Chapter 10 of the 2000 Highway Capacity Manual and are summarized in Table 2.3.

Table 2.3
Levels of Service Criteria
Signalized Intersections

Levels of Service	Delay per Vehicle (Seconds)
A	< 10.0
B	10.1 To 20.0
C	20.1 To 35.0
D	35.1 To 55.0
E	55.1 To 80.0
F	> 80.0

Existing Level of Service

Providence Road (Route 122) experiences relatively minor delays and queuing at this intersection and operates at a LOS A during the AM and PM peak hours (See Table 2.4). However, the eastbound and westbound approaches from Millbury Street experience severe delays and excessive queuing and operate at a LOS F during the AM and PM peak hours.

Table 2.4
Existing Level of Service-2009
(Non-signalized Intersection)

Intersection	Approach	AM Peak Hour			PM Peak Hour		
		LOS	Queue (Veh)	Delay (Sec)	LOS	Queue	Delay (Sec)

	Pleasant (WB)	A	0	0	A	0	0
	Follen (SB)	D	2	28.1	B	1	12.8

Note: Queue length is 95 percentile and is measured in car lengths of 25 feet each

3.0 FUTURE TRAFFIC CONDITIONS

3.1 Traffic Signal Warrant Analysis

Part IV of the Manual on Uniform Traffic Control Devices (MUTCD) 2000 Millennium edition was utilized to perform the traffic signal warrant analysis. The MUTCD defines eight (8) criteria for which a signal may be warranted based upon vehicular or pedestrian volumes, roadway geometry, traffic accidents and/or vehicular delays.

Warrant 1, Eight-Hour Vehicular Volume

The Minimum Vehicular Volume, Condition A, is intended for application where a large volume of intersecting traffic is the principal reason to consider installing a traffic control signal. Table 3.1 and 3.2 is a recreation of Table 4C-1 found on page 4C-5 of the MUTCD (Millennium Edition).

Table 3.1
Warrant 1, Eight-Hour Vehicular Volume (Condition A)

<i>Condition A- Minimum Vehicular Volume</i>						
Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total on both approaches)			Vehicles per hour on higher-volume minor-street approach (one direction only)	
<u>Major Street</u>	<u>Minor Street</u>	<u>100%^a</u>	<u>80%^b</u>	<u>70%^c</u>	<u>100%^a</u>	<u>80%^b</u>
1.....	1.....	500	400	350	150	120
2 or more....	1.....	600	480	420	150	120
2 or more....	2 or more...	600	480	420	200	160
1.....	2 or more...	500	400	350	200	160

^aBasic minimum hourly volume.

^bUsed for combination of Conditions A and B after adequate trial of other remedial measures.

^cMay be used when the major-street speed exceeds 70 km/h (40 mph) or in an isolated community with a population of less than 10,000.

The interruption of Continuous Traffic, Condition B, is intended for application where the traffic volume on a major street is so heavy that traffic on a minor road suffers excessive delay or conflict in entering or crossing the major street.

Table 3.2
Warrant 1, Eight-Hour Vehicular Volume (Condition B)

<i>Condition B-Interruption of Continuous Traffic</i>						
Number of lanes for moving traffic on each approach		Vehicles per hour on major street (total on both approach)			Vehicles per hour on higher-volume minor-street approach (one direction only)	
<u>Major Street</u>	<u>Minor Street</u>	<u>100%^a</u>	<u>80%^b</u>	<u>70%^c</u>	<u>100%^a</u>	<u>80%^b</u>
1.....	1.....	750	600	525	75	60
2 or more....	1.....	900	720	630	75	60
2 or more....	2 or more...	900	720	630	100	80
1.....	2 or more...	750	600	525	100	80

^aBasic minimum hourly volume.

^bUsed for combination of Conditions A and B after adequate trial of other remedial measures.

^cMay be used when the major-street speed exceeds 70 km/h (40 mph) or in an isolated community with a population of less than 10,000.

Warrant Satisfied for all intersections. See Warrant Summary.

Warrant 2, Four-Hour Vehicular Volume

The four hour vehicular volume signal warrant conditions are intended to be applied where the volume of intersecting traffic is the principal reason to consider installing a traffic control signal. Refer to Figure 4C-1 and 4C-2, page 4C-7, MUTCD (Millennium Edition).

Warrant Satisfied for all intersections. See Warrant Summary.

Warrant 3, Peak Hour

The Peak Hour Signal Warrant is intended for use at a location where traffic conditions are such that for a minimum of an average day, the minor street traffic suffers undue delay when entering or crossing the major street. Refer to Figure 4C-3 and 4C-4, page 4C-9, MUTCD (Millennium Edition).

Warrant Satisfied for all intersections. See Warrant Summary.

Warrant 4, Pedestrian Volume

The Pedestrian Volume Signal Warrant is intended for application where the traffic volume on a major street is so heavy that pedestrians experience excessive delay in crossing the major street.

Warrant does not apply.

Warrant 5, School Crossing

The School Crossing Signal Warrant is intended for application where the fact that school children cross the major street is the principal reason to consider installing a traffic control signal.

Warrant does not apply.

Warrant 6, Coordinated Signal System

Progressive movement in a coordinated signal system sometimes necessitates installing traffic control signal at intersections where they would not otherwise be needed in order to maintain proper platooning of vehicles. The coordinated traffic signal system signal warrant should not be applied where the resultant spacing of traffic control signals would be less than 300m (1,000 ft).

Warrant does not apply.

Warrant 7, Crash Experience

The Crash Experience Signal Warrant conditions apply where the severity of accidents are the principal reasons to consider installing a traffic control signal.

Warrant Satisfied for all intersections. See Warrant Summary.

Warrant 8, Roadway Network

Installing a traffic control signal at some intersections might be justified to encourage concentration and organization of traffic flow on a roadway network.

Warrant Satisfied for all intersections. See Warrant Summary.

GRAPHIC SCALE

Based on the Warrant Analysis of the three major intersection within the project area it has been determined that traffic signals are warranted in all locations. The major contributor to the need for signals is the volume of traffic on the major movement, Mass Ave, and the opposing side street left turning traffic at Marret and Maple Street.

3.2 Intersection Analyses

Roadway improvement projects are normally designed to accommodate traffic projected to a future design year, usually 10-20 years. A 20-year design horizon to a Design year 2029 has been selected for this project.

To provide analysis of proposed conditions, it is necessary to determine design year (2029) volumes. This was accomplished by increasing 2009 volumes based on a rate of 1% per year to the year 2029. This increase in growth rate will be coordinated with the Town Planning Department and the Regions Planning Agency.

Traffic operations for this study were analyzed according to standard procedures and practices outlined in the "Highway Capacity Manual 2000" published by the Transportation Research Board.

Traffic flow through an intersection is measured in terms of capacity and LOS. Capacity of an intersection is defined for each approach as the maximum rate of flow that passes through the intersection under prevailing traffic, roadway and/or signalized conditions. LOS is the qualitative measure of the efficiency of traffic flow assigned as a result of the capacity analysis. LOS is described in terms of Levels A through F, where LOS A represents the best possible conditions and LOS F represents forced-flow or failing conditions. Generally, LOS C or better is considered acceptable, although in urban locations, LOS D is also considered acceptable during peak periods.

At signalized intersections, LOS is defined in terms of average delay per approach (see Table 2.3 for signalized LOS criteria). For non-signalized intersections, reserve capacity is used to determine LOS conditions (see Table 2.2 for non-signalized LOS criteria). Average delay measures the mean stopped delay experienced by vehicles entering a signalized intersection during the peak hour period. Average delay is measured for each individual approach and the intersection as a whole. The LOS tends to decrease as average delays increase.

Reserve capacity is the unused capacity of the minor approach and is typically the controlled approach. Reserve capacity is defined in vehicles per hour and indicates the number of additional vehicles using an individual approach that would bring the facility to capacity.

The following is a summary of the project intersections analyzed under Existing 2009 Non-signalized, Existing 2009 Signalized, Future 2029 Non-signalized and Proposed 2009 Signalized scenarios.

Existing 2009 Volumes Analyzed Under Existing (Non-Signalized) Conditions

See Appendix for analysis results by intersection as follows:

Mass Ave @ Marrett Road

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS F for the eastbound left turn and a LOS B for the eastbound right turn and a LOS A for the northbound and southbound approaches to the intersection.

The analysis of the PM peak hour volumes resulted in a LOS F for the eastbound left turn and a LOS C for the eastbound right turn and a LOS A for the northbound and southbound approaches to the intersection.

Mass Ave @ Maple Street

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS F for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS A for the northbound approach and a LOS A and LOS C for the southbound through and left turn respectively.

The analysis of the PM peak hour volumes resulted in a LOS F for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS A for the northbound approach and a LOS A and LOS B for the southbound through and left turn respectively.

Mass Ave @ Pleasant Street

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS F for the eastbound approach and a LOS B and a LOS A for the northbound and southbound approaches respectively.

The analysis of the PM peak hour volumes resulted in a LOS F for the eastbound approach and a LOS A for both the northbound and southbound approaches.

Pleasant Street @ Follen Road

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS D for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

The analysis of the PM peak hour volumes resulted in a LOS B for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

Projected 2029 Volumes Analyzed Under Existing (Non-Signalized) Conditions

The results of the Non-signalized analysis for the 2009 existing conditions indicates a LOS F for most of the side street approaches to Mass Ave. As a result of the increase in traffic volumes over the 20-year period the LOS will deteriorate to a worse degree for the existing traffic volumes projected forward for a 20-year time frame and therefore was not analyzed.

Existing 2009 Traffic Volumes Analyzed Under Proposed Traffic Control

See Appendix for analysis results by intersection as follows:

Mass Ave @ Marrett Road

The signalized analysis of the existing AM peak hour volumes resulted in a LOS C for the eastbound left turn and a LOS A for the eastbound right turn, a LOS D for the northbound left turn and a LOS A for the northbound through, a LOS B for the southbound approach to the intersection. ***The resultant LOS for the intersection was a LOS B.***

The analysis of the PM peak hour volumes resulted in a LOS C for the eastbound left turn and a LOS A for the eastbound right turn, a LOS A for the northbound left turn and a LOS A for the northbound through, a LOS B for the southbound approach to the intersection. ***The resultant LOS for the intersection was a LOS A.***

Mass Ave @ Maple Street

The signalized analysis of the existing AM peak hour volumes resulted in a LOS C for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

The analysis of the PM peak hour volumes resulted in a LOS C for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

Mass Ave @ Pleasant Street

The signalized analysis of the existing AM peak hour volumes resulted in a LOS B for the eastbound approach, a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

The analysis of the PM peak hour volumes resulted in a LOS B for the eastbound approach, a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

Pleasant Street @ Follen Road

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS D for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

The analysis of the PM peak hour volumes resulted in a LOS B for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

The capacity analyses of existing traffic volumes analyzed under traffic signal control resulted in a LOS B for all movements during both the AM and PM peak hours.

Projected 2029 Traffic Volumes Analyzed Under Proposed Traffic Control

See Appendix for analysis results by intersection as follows:

Mass Ave @ Marrett Road

The signalized analysis of the existing AM peak hour volumes resulted in a LOS C for the eastbound left turn and a LOS A for the eastbound right turn, a LOS D for the northbound left turn and a LOS A for the northbound through, a LOS B for the southbound approach to the intersection. ***The resultant LOS for the intersection was a LOS B.***

The analysis of the PM peak hour volumes resulted in a LOS C for the eastbound left turn and a LOS A for the eastbound right turn, a LOS A for the northbound left turn and a LOS A for the northbound through, a LOS B for the southbound approach to the intersection. ***The resultant LOS for the intersection was a LOS A.***

Mass Ave @ Maple Street

The signalized analysis of the existing AM peak hour volumes resulted in a LOS C for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

The analysis of the PM peak hour volumes resulted in a LOS C for the westbound left turn (the westbound right turn is a yield that operates out of the intersection), a LOS B for the northbound approach and a LOS B for the southbound approach. ***The resultant LOS for the intersection was a LOS B.***

Mass Ave @ Pleasant Street

The signalized analysis of the existing AM peak hour volumes resulted in a LOS B for the eastbound approach, a LOS B for the northbound approach and a LOS B for the southbound approach. *The resultant LOS for the intersection was a LOS B.*

The analysis of the PM peak hour volumes resulted in a LOS B for the eastbound approach, a LOS B for the northbound approach and a LOS B for the southbound approach. *The resultant LOS for the intersection was a LOS B.*

Pleasant Street @ Follen Road

The non-signalized analysis of the existing AM peak hour volumes resulted in a LOS D for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

The analysis of the PM peak hour volumes resulted in a LOS B for the southbound (out of Follen) approach and a LOS A for the eastbound and westbound approaches to the intersection.

The capacity analyses of existing traffic volumes analyzed under traffic signal control resulted in a LOS B for all movements during both the AM and PM peak hours.

3.3 Summary

The analysis of the existing (2009) and future (2029) traffic conditions indicates that the non-signalized intersections operate at an unacceptable LOS with the side streets operating at a LOS F. This is due to the high Mass Ave volume of traffic and the conflicting left turning movements from the side streets. Without a formal way of allowing the side street traffic to make their turns across Mass Ave there is not enough gaps in the Mass Ave traffic stream to allow this to happen without causing major delays and unacceptable LOS for the sides streets.

The analysis of existing (2009) traffic volumes under signalized conditions indicates that with the addition of traffic signals to the project intersections the needed gaps for the side street traffic are supplied and the intersections operate at a reasonable LOS. Analysis of the 2029 traffic volumes under traffic signal control also indicates that with the addition of traffic signals to the project intersections a reasonable LOS is realized. The difference is that the 2029 analysis indicates several movements with poor LOS and the queue lengths are typically longer than those of the 2009 analysis year.

The results of the signalized intersection analysis under 2009 and 2029 projected volumes is as follows:

Table 3.6
Future Level of Service - AM 2009/2029
(Signalized Intersection)

Intersection	2009 AM Peak Hour			2029 AM Peak Hour		
	LOS	Queue (Veh)	Delay (Sec)	LOS		Delay (Sec)

Southbound Right	A	1		A	1	
Pleasant St @ Follen *	B		12.8	B		14.8

* Peasant @ Follen is non-signalized in the future

As a result, calculations indicate the operation of the intersections will improve considerably during the AM and PM peak hour with the installation of new traffic signals given the 2009 volume conditions. The intersections will also operate at considerably better LOS given the 2029 volume conditions, however, the delay is slightly longer and the queue lengths are also slightly longer.

CONCLUSIONS AND RECOMMENDATIONS

Based on the information and traffic volume collected and the analysis contained herein, the following improvements are recommended at the project intersections:

- Install fully actuated traffic signal systems with overhead signal mounting for each lane approach at each intersection.
- Reconfigure the lane arrangement at Mass Ave to include a Southbound Thru and Thru Right lanes.
- Restructure the lane arrangement on Mass Ave to supply a four lane cross section. This will allow for ease of stacking in the future and allow the heavy Mass Ave through volumes to move with less constriction. Reconstruct existing driveways to meet the new pavement edge. This will require the narrowing of the existing tree lawn by an average of 2 feet on each side of Mass Ave.
- Reconfigure the islands at Mass Ave @ Pleasant Street to supply more of a wide median. The existing round island will be utilized within the wide median configuration to greatest extent possible to save the existing vegetation. In addition, narrow the amount of pavement in this intersection and reconfigure the entrance of Pleasant Street @ Follen Road.

Key for MVA Summary Report Codes

#accid	Total number of accidents
dow	Day of Week
hr	hour
ta	type of accident
#veh	Number of vehicles involved

Number and extent of injuries:

#fat	number of fatalities
#ija	incapacitating (serious visible injury)
#ijb	non-incapacitating (minor visible injury)
#ijc	possible (not visible but complains of pain)
tc	traffic conditions
pd	property damage ?
rs	resident ?
flt	Fault (D)rive (R)oad (A)lcohol

Over Limit Prop Damage ... Involving damage in excess of \$1000

All Resident of Town/City – Involved Residents of Lexington

Total Accidents Injury/Fatal – Total number of accidents involving injuries

Fault – Driver error
 Road conditions
 Alcohol/Drugs
